Continuation of 11. does NOT place the application in condition for allowance because: As to the newly amended specified value in the branch instruction in claim 1, and the argument directed to this feature in applicant's response on 12/27/05, Hasegaga taught clearly Branch after 3 to x (see fig.5A). The x is the target address, and the 3 is the value specified in the branch instruction. If the value is not equal to 3, no x address would be targeted. Therefore, the "Yes" and 'No" was the true and false. As to the argument by applicant that the Z flag was set previously by other instruction , not by branch, Hasegawa taught his predictive branch instruction was decoded , and as result, a value of 3 was stored in the region 23 of the branch instruction, and this is inputted to the down counter 31 as the intial value of the Z flag (see col.9, lines 44-50). Therefore, it is clear that Hasegawa's branch instruction did specify the Z (the intial value of Z) itself .
